GRAPHITE

COPPER

perfect GUTTER Kanion

The Kanion rainwater system was created in co-operation with roofers and fitters, who gave it the original, elegant and stylish design. The characteristic feature of the system is its traditional yet unique profile, which changes the appearance of every building, highlighting its architectural qualities.

Kanion is intended for use in detached houses, terraced blocks, commercial premises, as well as industrial buildings, arbours, garden sheds, garages and balconies. The design of the Kanion system was based on results of marketing research conducted to determine specific user expectations. Based on our in-depth market knowledge, access to cutting-edge technologies and state-of-the-art materials, and the desire to create a perfect system, we have managed to develop a unique product.

Kanion is a rainwater system that lives up to expectations of the most demanding customers. It combines the elegant design with high water drainage efficiency. The system's hydraulic performance

and functional design ensure smooth flow of water, even during heavy storms.

Individual elements of the system are press-fitted, only external stopends are glued. As a result, no specialist tools are required to install the system; however, expert's support is recommended to ensure that the system is properly installed and leakproof. The Kanion gutters are 100% maintenance-free and characterised by high durability, tightness and efficiency of roof rainwater drainage.

Kanion is an attractive solution for the customers mainly because of its elegant design and high quality of workmanship. Individual system components are either single-packed in foil bags to prevent any mechanical damage during transport.

The Kanion gutters are 100% resistant to rainwater contaminants, which is of prime importance in seaside areas and in the aggressive industrial environment.

Kanion rainwater system

2. Technical data

2. Technical data

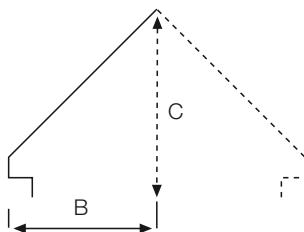

Gutter Flow Capacity

Effective roof area (in square metres) can be calculated using the following formula:

$$\text{Effective roof area} = (B + C/2) \times \text{roof length}$$

B – horizontal distance from the eaves to the roof ridge

C – height of roof

Maximum roof area to be drained by one outlet:

- gutter fall 3‰ (3 mm per 1 m of the gutter)
- rainfall intensity 75 mm/h

Maximum roof area (m²)

	Gutter 75*/ pipe 50*	Gutter 100*/ pipe 75*	Gutter 130*/ pipe 90*	Gutter 130*/ pipe 110*	Gutter 160*/ pipe 110*

General information

Storage and transport

Pipes and gutters must be stored on a smooth surface, free of any sharp edges and surface roughness. Products must not be stacked in more than 7 layers, to ensure that elements stored at the bottom are not deformed. Fittings of various types must be stored indoors in their original packaging (foil bags) until unpacked. It is recommended that products are securely fastened while in transport. Loading and unloading of loose gutters and pipes must be manual. Special care must be taken when transporting products during winter, as low temperatures reduce the resistance of plastics to mechanical impact.

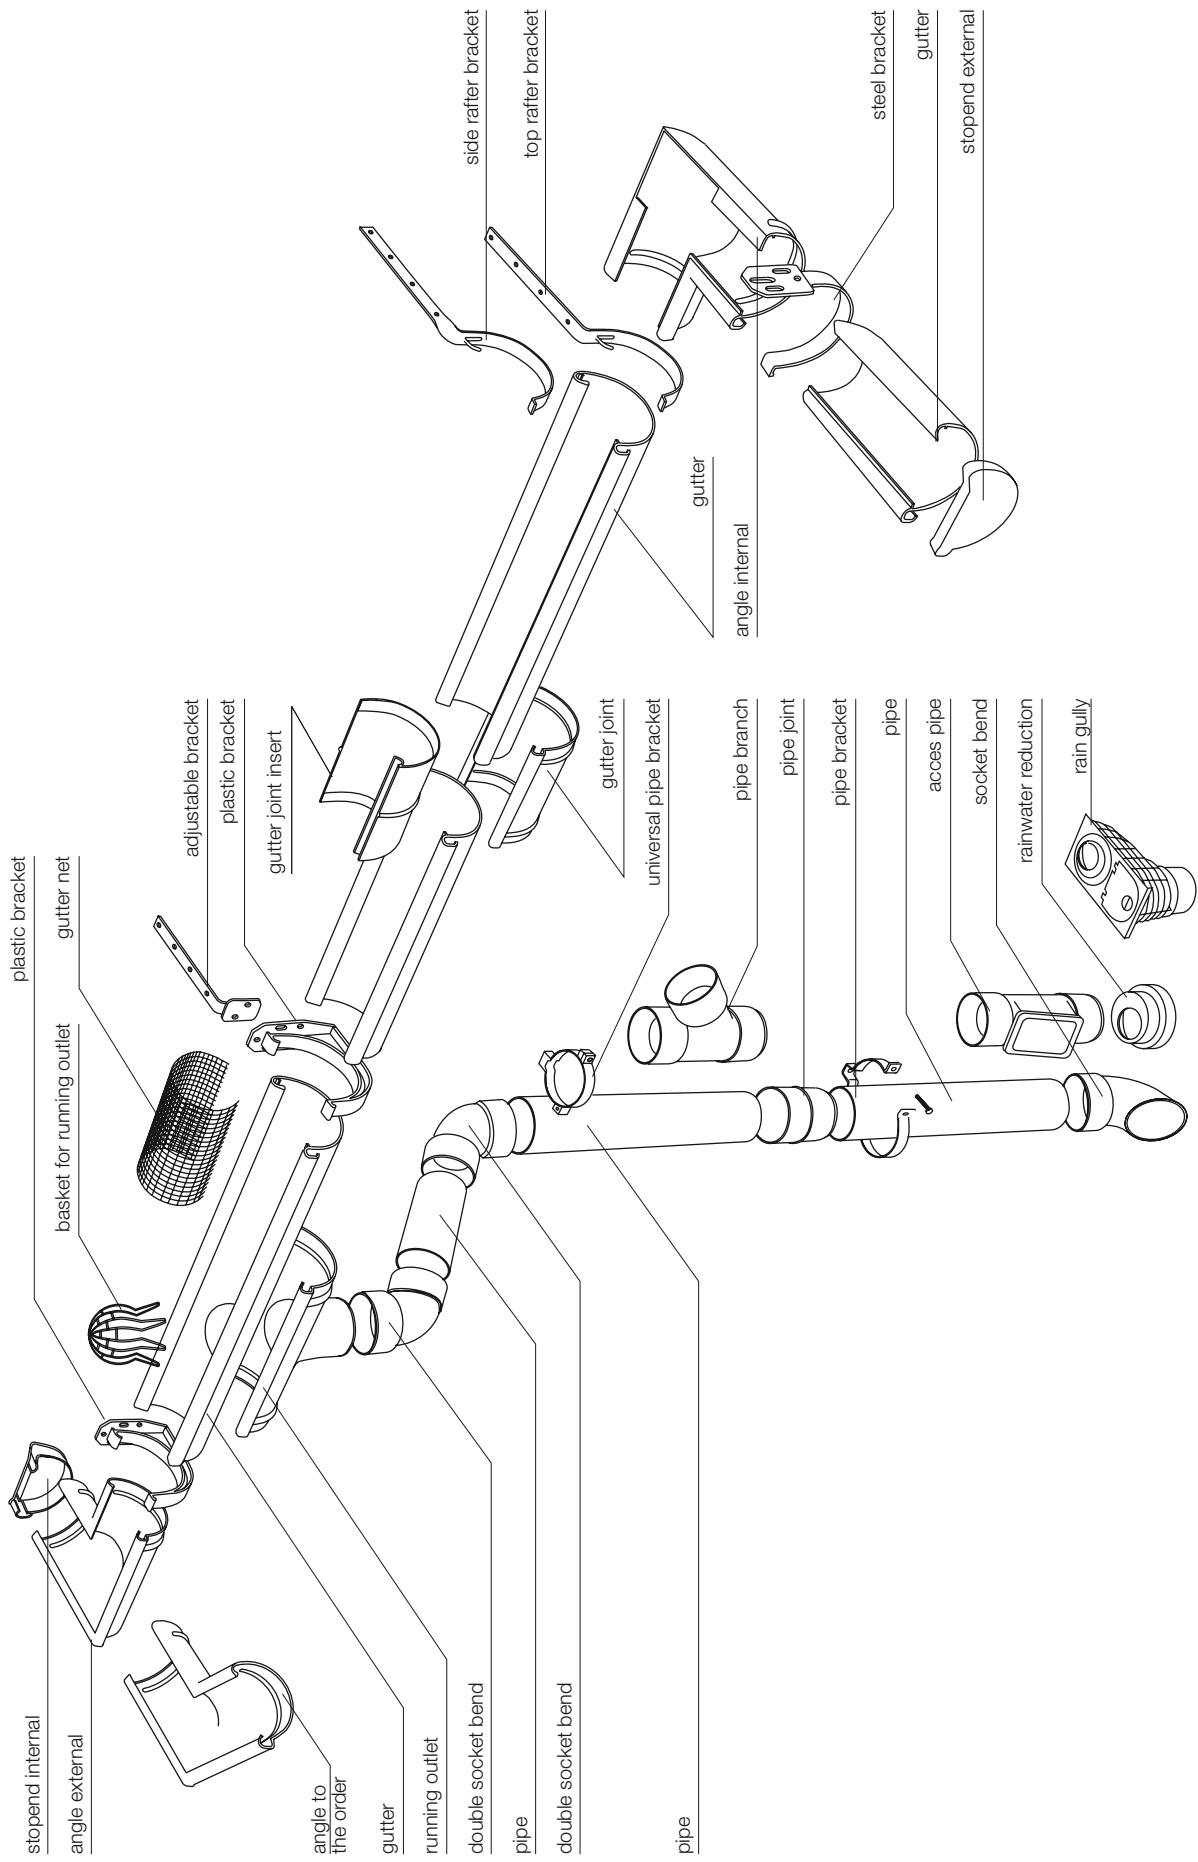

Standards and approvals

- European Standard PN-EN 607
- European Standard PN-EN 12200
- European Standard PN-EN 1462
- Approval of the National Institute of Hygiene no. HB/B/2830/01/98
- Certificate of conformity no. ITB-0678/W

Basic elements of the Kanion rainwater system

Kanion rainwater system

3. Installation guide

Having calculated the roof area to be drained, determine the method of installation of the gutter to the roof construction and downpipe

3. Installation guide

to the wall of the building (type of brackets), and then specify the number of individual elements required to install the system.

Gutter installation elements

The following elements can be used to install the Kanion gutter:

- top rafter or side rafter steel brackets, long and short, fixed to both rafters and battens,
- adjustable steel brackets, top rafter or side rafter, long and short, with a plastic bracket connected with two screws; the entire system is fixed to both rafters and battens,

■ fascia steel brackets – fixed to the roof fascia board,

■ fascia plastic brackets – also fixed to the roof fascia board.

The maximum distance for all types of gutter brackets should be 70 cm. In areas with heavy snowfall it is recommended to fasten brackets every 50 cm.

Downpipe installation elements

The following elements can be used to install downpipes in the Kanion system:

- universal steel pipe bracket with a nut; depending on the wall structure, to be used with double-side male screws with the length of 100, 160 or 220 mm (concrete walls) or a support bracket bracer (wooden or metal walls),

■ plastic pipe bracket with a nut; depending on the wall structure, to be used with double-side male screws with the length of 100, 160 or 220 mm (concrete walls); alternatively, special support bracket bracer may be used to fix the bracket to wooden or metal walls.

The maximum distance between all types of gutter brackets should be 2 metres.

Basic principles of installation

To ensure proper performance of the rainwater system, the following guidelines must be followed:

1. It is important to install gutters at an appropriate height in relation to the slope of the roof. Gutters should not stick out beyond the line formed by prolonged surface of the roof; otherwise, gutters will be the only support for heaps of snow accumulating on the roof (fig. 1).
2. If it is not possible to install gutters in accordance with these guidelines, snow boards should be used. Snow boards should also be installed wherever the roof slope is facing south, and when the roof is covered with metal sheet or other slippery roofing material. In areas with heavy snowfall it is recommended to use snow boards regardless of the roof covering and direction.
3. Gutters should extend outside the ridge of the roof slope with approx. 50% of their width, so that water always flows into the gutter.

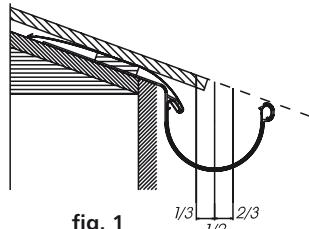

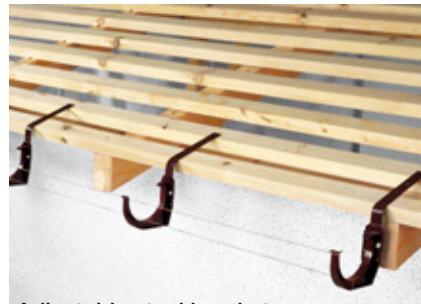

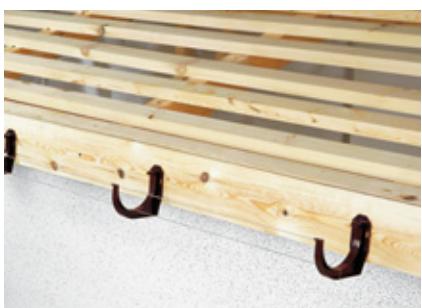

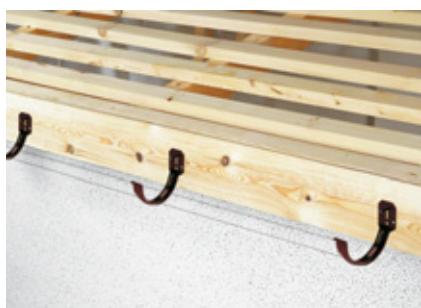

fig. 1

4. If the Kanion 160 system is installed in large buildings, controlled extension of gutters must be ensured. The so-called fixed points must be marked every 12 metres of the gutter. To that end, gutter brackets must be installed on both sides of the coupler to fasten it securely in place. Other brackets are installed with the required distance.
5. To make system installation as easy as possible, lubricate the seals.
6. Special care should be taken to protect installed gutters when the roof is covered with the torching membrane using a burner.
7. Rainwater system should be installed at the minimum ambient temperature of 5°C.
8. To install the system, use only the Kanion rainwater system elements with appropriate manufacturer's designations.
9. Installation guide presented in the catalogue should be followed.

Installation guide**Installation of top rafter steel brackets****Side rafter steel brackets****Adjustable steel brackets****Plastic fascia brackets****Fascia steel brackets****Cutting the gutter****Installation of the gutter in plastic brackets****Installation of the gutter in steel brackets****Installation of the gutter union**

7. The gutter is installed by placing its front flange in the front end of the bracket, and then pressing its back flange under the back end of the bracket.

8. See point 7.

9. The gutter union should first be placed on the front flange of connected gutters. Do not move gutters towards the centre of the coupler beyond the "gutter ends" markings. Next, snap the back end of the gutter union on the back flange of the gutter. Alternatively, the gutter union can be placed in the back flange of the gutter first and then snapped in place on the front flanges of connected gutters.

Kanion rainwater system

3. Installation guide

Installing the gutter union insert

Installing the running outlet

12. Remove the running outlet and cut the opening in the gutter with a metal-cutting saw.

13. Having removed all sharp edges around the opening, place the running outlet on the gutter and fasten both elements in brackets.

Installing the angles

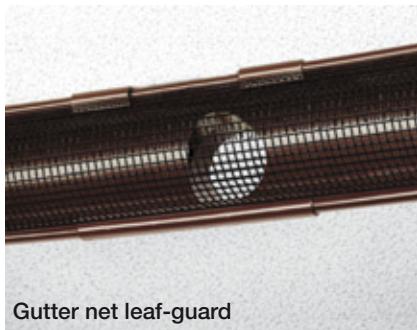

External stopends

14. Two types of angles are on offer: internal and external, to fit the system profile. Both types of angles are fitted with seals. To install the angle on the gutter, first remove the gutter from the nearest bracket, place the front flange of the gutter in a slot in the front part of the angle, and then securely fasten the angle on the gutter, snapping the back part of the gutter in place under the flanged profile.

Internal stopends

16. Internal stopends are used when the running outlet or the angle is the final part of the system. The stopend is inserted into the fitting so that it touches the gasket. No glue is used to fasten these elements.

Gutter net leaf-guard

17. The diameter of the gutter net leaf-guard protecting the gutter against leaves and contamination is slightly larger than the gutter; it is therefore simply placed inside of the gutter.

Installing the downpipes using two bends

18. If the roof eaves sticks out, but the horizontal distance between the port of the running outlet and the pipe does not exceed 10 cm, the gooseneck can be made with a single-socket bend installed on the running outlet, and a double-socket bend installed on the spigot of the single-socket bend (flange downwards). Remembered that after the downpipe is inserted into the flange of a double-socket bend, the play of approx. 10 mm must be left (due to thermal expansion of pipes). The bracket must be mounted directly under the bend.

Installation guide cont.

Installing the downpipes using two bends and a pipe section

Pipe connecting

Fastening downpipes to a concrete wall

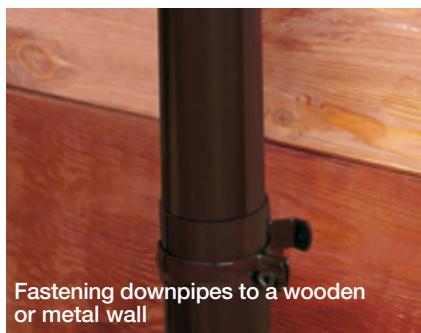

19. If the distance between the eaves edge and the wall of the building exceeds 10 cm, the gooseneck must be made using a double-socket bend mounted on the port of the running outlet, flange downwards. Insert the pipe section into the flange, and another double-socket bend at the longer end. The bracket must be mounted directly under the bend.

20. Pipes are connected with pipe connectors, with flanged parts always facing downwards. Remember to leave the play of approx. 10 mm (due to thermal expansion of pipes). The bracket must be mounted directly under the coupling.

21. To install the downpipes to a concrete wall, use the universal bracket. Depending on the requirements (for instance, styrofoam cladding), double-side male screws with expansion plugs may be used (length: 100, 160 or 220 mm).

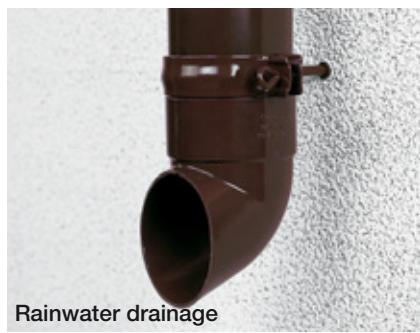

22. The maximum distance between brackets is 2 metres.

Fastening downpipes to a wooden or metal wall

23. To install the downpipe to a wooden or metal wall, use a bracket with a support bracket bracer and fix the bracket to the wall using two wood or metal screws.

Rainwater drainage

24. Rainwater can be drained off the roof to the ground with a single-socket bend installed above ground. The bend may be trimmed so that the outlet is parallel with the pipe...

25. ...or may be left as it is. The bend can be glued to the pipe.

Connecting the system to the sewage system

26. If the rainwater system is to be connected to the sewage system, a access pipe must be installed in the lower section of the downpipe. The access pipe has a grate inside to collect impurities from the gutter. A tight cover is placed at the top. Before the access pipe cover (110 mm in diameter) is closed again, the seal should be lubricated. The connection between the downpipe (diameter: 75 mm and 90 mm) and the sewage piping (diameter: 110 mm) is made with a reducer.

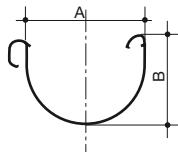

27. It is also possible to connect the rainwater system directly to the sewage system with a universal rain gully, ensuring a frost-proof, water-free odour protection; a removable basket strainer placed inside the drain collects leaves and other impurities before they enter the sewage system. Replaceable eccentric rings are used for easy connection of downpipes with the diameter of 50 mm, 75 mm, 90 mm and 110 mm.
